

Cyber Banking Lab — Student Setup Guide

This guide will help you set up and run the **Procentric Cyber Bank** vulnerability range on your local Kali Linux machine using Docker.

Prerequisites

Make sure your Kali Linux system is updated and connected to the internet. Since we are using Docker, you do not need to manually install Python, Flask, or any database packages on your host machine.

Step-by-Step Installation

Step 1: Open the Terminal and Update Packages

Open your terminal in Kali Linux and run the following command to update your system's package list:

```
sudo apt update
```

Step 2: Install Git and Docker

If you do not have Git or Docker installed on your system yet, run this command to install both:

```
sudo apt install -y git docker.io
```

Step 3: Start the Docker Service

Kali Linux does not automatically start background services by default. Start Docker and enable it to run using these commands:

```
sudo systemctl start docker  
sudo systemctl enable docker
```

Step 4: Clone the Lab Repository

Download the lab codebase from GitHub directly to your machine:

```
git clone https://github.com/tibinjohn193-blip/procentric-cyber-bank.git
```

Step 5: Move Into the Project Directory

Navigate into the newly created folder:

```
cd procentric-cyber-bank
```

Step 6: Build the Docker Image

Compile the lab environment. **CRITICAL:** Do not forget the space and the period (.) at the very end of this command. The dot tells Docker to look inside your current directory for the setup files.

```
sudo docker build -t procentric-cyber-bank .
```

(Note: This process may take 1–3 minutes during the first setup while Docker downloads the secure Python environment baseline.)

Step 7: Run the Cyber Bank Container

Launch the cyber range container in the background and map it to your local port 5000:

```
sudo docker run -d -p 5000:5000 --name cyber-bank-range procentric-cyber-bank
```

How to Access the Lab

Once the container is running, open your web browser (Firefox/Chrome) inside Kali Linux and go to the following URL:

 <http://localhost:5000>

From here, you can click "**Open Account Online**" to register your hacker profile, log in, and view the 9 lab challenges!

Turning the Lab On/Off Later

If you close your machine or power down your VM, the lab will turn off. You **do not** need to re-run the entire build process. Simply open your terminal and use these quick controls:

- To start the lab again:

```
sudo docker start cyber-bank-range
```

- To stop the lab temporarily:

```
sudo docker stop cyber-bank-range
```

- To check if the lab is currently running:

```
sudo docker ps
```
